```
This cDNA encodes a human RANKL, a ligand for the RANK (receptor CC activator of necrosis factor-kappaB (NF-MB)) polypeptide. RANK is a CC member of the tumour necrosis factor (TNF) family. A soluble RANK CC member of the tumour necrosis factor (TNF) family. A soluble RANK CC may be used for inhibiting activation of NF-MB, by contacting a cell CC expressing membrane-associated RANK with a soluble RANK which binds to CC RANK ligand (RANKL). RANKL polypeptides can activate RANK and can be CC used to induce maturation of dendritic cells and enhance their CC soluble RANK polypeptide composition may also be used for regulating an collaboration of inflammatory response. Inhibition of NF-MB by RANK antagonists CC immune or inflammatory response. Inhibition of NF-MB by RANK antagonists CC response that result from triggering of RANK, e.g. in treating toxic reactions. They can also be used in adjunct therapy for disease CC characterised by neoplastic cells that express RANK. RANKL polypeptides can also be used to identify inhibitors of RANK and thus inhibitors of CC an inflammatory response, and also for protecting RANK-expressing cells from the negative effects of chemotherapy or the presence of high levels of TMF-alpha. The products can also be used for detection and drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ъ

RANK is a CC member of the tumour necrosis factor (TNF) family. Host cells transformed CC or transfected with an expression vector comprising the RANK encoding CC nucleic acid can be used to produce recombinant RANK protein. The soluble CC RANK may be used for inhibiting activation of NF-kB, by contacting a cell CC expressing membrane-associated RANK with a soluble RANK which binds to CC RANK ligand (RANKL). The soluble RANK polypeptide composition may also be used for regulating an immune or inflammatory response. Inhibition of CC used for regulating an immune or inflammatory response. Inhibition of CC used for regulating an immune or inflammatory response. This effects of an inflammatory response that result from triggering of RANK, e.g. in CC treating toxic shock or sepsis, graft-versus-host reactions, or acute CC inflammatory reactions. They can also be used in adjunct therapy for CC disease characterised by neoplastic cells that express RANK. The products CC can also be used for detection and drug screening.

The patent discloses novel receptor activator of nuclear factor (NF)-kappaB (RANK) proteins and their corresponding DNAs. RANK is a member of the tumour necrosis factor (TNF) receptor superfamily and associates with TNF receptor associated factor (TRAF) 2 and 3 which are important in the regulation of immune and inflammatory response. The receptors

cc molecules that inhibit interaction of RANK with TRAFI, TRAF3, CC TRAF5 and particularly TRAF5. NF kappaB inhibition by RANK antagonists care useful in ameliorating the negative effects of an inflammatory consists of special result from triggering of RANK, e.g. in treating toxic consoled or sepsis, graft-versus-host reactions, acute inflammatory creactions and the effects of bone resorption. RANK acts as an anti-cc apoptotic signal and rescue the cells that express RANK from apoptosis. Cc soluble forms of the receptor are used in vivo or in vitro based cc screening tests for agonists or antagonists of RANK activity, as antagonists of RANK-mediated NF-kappa B activation, or to inhibit capping the form of a signal via RANK. Compositions are used in the development of both agonistic and antagonistic antibodies, or as an cappuress RANK. Compounds that interfere with RANK-TRAF6 interactions care useful for modulating the formation of osteoclasts from osteoclast precursors and for modulating osteoclast function and activities. They care used as inhibitors of disease associated with excess bone resorption and as immunosuppressants or anti-inflammatory agents. The RANK DNAs are useful for the expression of recombinant proteins, as probes for analysis of the presence or distribution of RANK transcripts, while the proteins care useful in preparing kits for the detection of soluble RANK, or monitor RANK-related activity. The present sequence is a cDNA encoding complete the protein activity agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Дb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Qγ

The present invention relates to receptor activator of NF-chi B DNA. RANK is mapped to chromosome 18q22.1 and its ligand (RANKL) chromosome 13q14. RANK and RANKL are type 1 and type 2 transmemb

B (RANK)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           telns respectively. RANK is a member of the tumour necrosis factor IF) superfamily and it closely resembles CD40 in the extracellular ion. RANK associates with TNF receptor-associated factor (TRAF) 2 TRAF3. The DMA molecules are useful for producing ligands of RANK. Ilgands are useful for regulating immune response and in screening inhibitors of RANK. The present sequence is human RANKL (huRANKL)

Osteolysis

for the 'FEO' (FEO)

CC (receptor activator of NF (nuclear factor) -kappaB), a member of TNF CC (tunour necrosis factor) receptor superfamily. RANK is a Type I CC transmembrane protein that interacts with TNF receptor-associated CC factors (TRAFS). Triggering of RANK by overexpression or co-expression of RANK and membrane bound RANK ligand (RANKL) results in upregulation CC of the transcription factor NF-kappaB, a ubiquitous transcription factor CC that is most extensively utilised in cells of the immune system. CC inhibition of Nf-kappaB by RANK antagonists is useful in ameliorating CC negative effects of inflammatory reactions, and the effects of excess cone resorption. The RANK DNAs, proteins and their analogues are useful CC cells for use in gene therapy applications in diagnosing diseases associated with RANK, and as targets for use in screening assays. They can be used in the treatment or diagnosis of immune system dysfunction. The present invention also encompasses gene therapy methods to correct costeolysis (PEO) and early onset paget's disease of bone (EP). The present sequence is a CDNA encoding full-length human RANKL (hurankil) cc protein. The RANKL gene is located in chromosome 13q14. The present invention relates to a novel receptor, referred RANK
